ABOUT QAFORGE

QAForge is a specialized software quality assurance company dedicated to helping software development agencies ship bug-free code to their clients. Founded by experienced QA professionals with deep expertise in testing web applications, SaaS platforms, and custom software, we understand the unique challenges agencies face.

Most software agencies don't have dedicated QA teams. Developers test their own code, bugs slip through, and clients discover issues in production. That's where we come in.

Our Mission

To provide software development agencies with world-class QA services at offshore pricing—so they can deliver flawless software to their clients without hiring expensive full-time QA engineers.

What Makes QAForge Different

🎯

QA-Only Focus

We don't build software. We ONLY test it. No conflicts of interest, no distractions. Pure quality assurance.

🔬

Agency-Specific Expertise

We specialize in testing software built by agencies for their clients—not products, not internal tools. We understand your workflow.

📋

Documented Processes

Every project follows our proven QA framework. Not random clicking. Structured test planning, execution, and reporting.

👥

Dedicated Teams

Same QA engineers work on your projects month after month. They learn your tech stack, your clients, your standards.

📊

Weekly Transparency

Every Friday: professional report showing what was tested, bugs found, pass rates, and next week's plan.

⚡

Fast Turnaround

We work in overlapping timezones with US/UK teams. Quick bug verification, rapid testing cycles.

We catch bugs before your clients see them—so you can deliver with confidence, every single time.

WHY SOFTWARE AGENCIES CHOOSE US

The Problem Software Agencies Face

Most software agencies struggle with quality assurance:

Developers Testing Their Own Code

- Bias blindness—they can't see their own bugs
- No structured testing process
- Testing happens at the last minute
- Inconsistent quality across projects

Bugs Reach Clients

- Clients discover issues in production
- Emergency weekend fixes under pressure
- Damaged reputation and lost trust
- Increased support ticket volume

Hiring is Too Expensive

- US QA engineers cost $100K-$134K/year
- Plus benefits, taxes, and training costs
- Hard to find qualified testers
- Not economical for every project

Freelancers Are Unreliable

- Disappear without notice mid-project
- No documentation or handoff
- Inconsistent testing quality
- Zero accountability or reporting

The QAForge Solution

We provide dedicated, professional QA teams that work exclusively on your client projects—structured, reliable, and 70% less expensive than hiring internally.

Hiring US QA Engineer

$100,000 - $134,000/year

+ Benefits, taxes, training + Recruitment costs (15-20% of salary) + Management overhead + Turnover risk + Onboarding time (3-6 months)

QAForge Dedicated Team

$24,000 - $84,000/year

✓ No benefits or taxes ✓ No recruitment costs ✓ Fully managed for you ✓ Team redundancy built-in ✓ Immediate start (1 week)

You save $60,000 - $90,000 per year while getting professional, structured QA services.

OUR TESTING SERVICES

We provide comprehensive software testing services specifically designed for web applications, SaaS platforms, and custom software projects.

✓ Functional Testing

Comprehensive testing of all features and user workflows. Forms, buttons, navigation, business logic—everything works as designed.

✓ API Testing

REST and SOAP API validation. Authentication, endpoints, request/response validation, data integrity, error handling.

✓ Regression Testing

Re-test after every change to ensure nothing broke. Catch unintended side effects before they reach production.

✓ Cross-Browser Testing

Chrome, Safari, Firefox, Edge—desktop and mobile browsers. Ensure compatibility across all major browsers.

✓ User Permission Testing

Role-based access control verification. Ensure users only see and access what they're authorized to.

✓ Performance Testing

Page load times, API response times, database query optimization. Identify and fix performance bottlenecks.

✓ Security Testing

Authentication bypass attempts, injection vulnerabilities, data exposure risks. Find security gaps before hackers do.

✓ Integration Testing

Third-party API integrations, payment gateways, email services. Verify all external connections work correctly.

✓ Usability Testing

Real user perspective on navigation, workflows, and interface design. Identify confusing UX patterns.

✓ Bug Documentation

Clear, detailed bug reports with reproduction steps, screenshots, severity levels, and fix recommendations.

✓ Test Case Library

Comprehensive test case documentation for your project. Repeatable, structured, professional testing.

✓ Weekly Reporting

Professional reports every Friday with metrics, findings, pass rates, and next week's testing plan.

What We Do NOT Test

To maintain our focus and expertise, we do not test:

- Mobile native apps (iOS/Android apps downloaded from stores)
- Hardware, IoT devices, or embedded systems
- Desktop software (Windows/Mac applications)
- Blockchain or cryptocurrency platforms

If your project involves web-based software, SaaS platforms, or web applications—we're the perfect fit.
